

Home Visiting Evidence of Effectiveness Reporting Guide for Study Authors

MAY 2016

This document provides guidance about how to describe randomized controlled trials and matched comparison group design studies and report their findings in a way that is clear, complete and transparent. Reporting the information described below is considered a best practice in general, but can also help reviewers from the Home Visiting Evidence of Effectiveness (HomVEE) review assess the appropriate **rating to assign** to the study.¹

I. Study Characteristics

| | |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A. Intervention Condition | Describe the home visiting program model in sufficient detail for readers to know what is being tested. Clearly define any core components of the program model. Describe qualities such as intended duration, intensity, content and delivery delivery (for instance, does the home visitor interact with the parent, the child, or both?); required and available training and assistance for home visitors; caseload size and supervision for home visitors. If the model includes services in addition to home visits, describe the duration and intensity of each type of service. Describe the actual implementation of the home visiting program model studied, including adaptations of content, level and variation in duration and intensity, and home visitor training and assistance received. |
| B. Comparison Condition | Describe the comparison condition on dimensions similar to those described for the intervention condition. If it includes an intervention, describe the comparison intervention and provide details on the actual implementation experience in the comparison condition. |
| C. Setting | Describe the location of the study, including indicators of the characteristics of the setting such as region and urbanicity, service delivery location (such as schools, child care centers, clinics, or participants' homes), and area demographic characteristics. |
| D. Participants | Describe the characteristics of the study participants before program services began (at baseline), including: <ul style="list-style-type: none"> • Race and ethnicity • Socioeconomic status (SES). Specific economic well-being measures (e.g., income, earnings, or poverty levels according to federal thresholds) are the preferred measures of SES. Alternative measures of SES, such as mean-tested assistance, maternal education, and employment of at least one member in the household, are sufficient if at least two of those alternative measures are provided. • Baseline measures of the outcomes of interest, if they are feasible to collect. (For instance, child outcomes are not feasible to collect at baseline if the sample enrolls during the mother's pregnancy.) Although not required by HomVEE, authors may wish to report participant baseline characteristics that may be of interest to home visiting programs and researchers, such as: percentage of sample who were pregnant, percentage of sample who were teen parents, and percentage of sample who were first-time parents. |
| E. Funding source and author affiliation | Describe the source of support for research on the program model and any author(s)' affiliation as a developer of the program model. |

II. Study Design and Analysis

| | |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A. Sample Formation | Describe how the study sample was identified, including eligibility for the study and for the home visiting intervention, if that differs from eligibility for the study in general. Clearly state the unit of assignment, especially if it differs from the unit of analysis (for instance, counties assigned to different conditions in a study where children's outcomes rather than county averages are analyzed). For randomized controlled trials, describe the random assignment process and any anomalies in it. For matched comparison group designs, describe the characteristics on which the intervention and comparison groups were matched. |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| | |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| B. Measures | For each outcome measure used in the study and for variables describing participants' characteristics, describe the measure, how it was collected, when it was collected, and how to interpret it if necessary. For each measure note whether it has been standardized and normed. |
| C. Analytic Approach | Describe the analytic models and methods used to estimate the effects of the home visiting program and, where relevant, the method used to calculate reported effect sizes. Describe the unit of analysis. |
| D. Statistical Adjustments | Include controls for race/ethnicity, SES, and any measures of the outcomes that were feasible to assess at baseline. Describe all control variables used in the analyses (definitions, means, and standard deviations); where relevant, also describe adjustments made to standard errors to account for clustering of the sample (e.g., within counties) and adjustments made to statistical significance levels to account for the analysis of multiple outcomes within the same domain or use of the same intervention or comparison groups in multiple analyses of the same outcomes. |
| E. Missing Data | Describe the method for addressing missing data (e.g., case deletion, nonresponse weights, imputation) for both outcomes and control variables and, if relevant, the method to adjust the standard errors of the impact estimates to account for the missing data. |

III. Study Data *(see associated tables on page 3)*

| | |
|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A. Pre-Intervention Data, Baseline Sample (Table 1) | If the design is a randomized controlled trial, provide sample sizes for key background characteristics (including race/ethnicity and SES) and for baseline measures of the outcomes or closely associated variables (if feasible to collect at baseline) for the sample that was randomly assigned. If the unit of assignment to condition is not the same as the unit of analysis, provide sample sizes at both the level of group assignment (e.g., counties) and level of analysis (e.g., mother or child). If multiple samples are analyzed, provide this information separately for each study group within each sample. |
| B. Pre-Intervention Data, Analysis Sample (Table 2) | Provide sample sizes, means, and standard deviations for race/ethnicity and SES and for baseline measures of the outcomes (or closely associated variables) for the sample that was analyzed. |
| C. Post-Intervention Data and Findings (Table 3) | For each outcome measure used in the study, and for each follow-up period assessed, provide means and standard deviations for the intervention and comparison groups, along with the p-value. HomVEE prefers adjusted means, unadjusted standard deviations, and adjusted p-values, but will rely on whatever authors submit and clear labeling of what has and has not been adjusted is helpful. HomVEE also prefers to report author-calculated effect sizes, if available, but this is not a requirement |

¹This author reporting guide is modeled after and includes language from an author reporting guide developed by the What Works Clearinghouse (WWC), a project of the U.S. Department of Education's Institute of Education Sciences. The HomVEE review is grateful to the WWC for introducing the concept of an author reporting guide and for having published the guide on which this is modeled.

Tables like the examples below can be used to report the study data described in section III on page 2.

Table 1. Pre-Intervention Sample Sizes and Characteristics for the Baseline Sample (see III.A.)

| Intervention Group | | | Comparison Group | |
|--------------------|--------------------|------------------|--------------------|------------------|
| Baseline Measures | Sample Sizes | | Sample Sizes | |
| | Unit of Assignment | Unit of Analysis | Unit of Assignment | Unit of Analysis |
| Measure 1 | | | | |
| Measure 2 | | | | |
| Measure 3 | | | | |

Table 1 contains information on **sample sizes** for the **baseline sample**, for both the intervention and comparison groups. This information is useful for determining **sample attrition** in randomized controlled trials.

Table 2. Pre-Intervention Sample Sizes and Characteristics for the Analytic Sample (see III.B.)

| Intervention Group | | | | Comparison Group | | | | |
|--------------------|--------------------|------------------|------------------------|--------------------|--------------------|------------------|------------------------|--------------------|
| Baseline Measures | Sample Sizes | | Sample Characteristics | | Sample Sizes | | Sample Characteristics | |
| | Unit of Assignment | Unit of Analysis | Mean | Standard Deviation | Unit of Assignment | Unit of Analysis | Mean | Standard Deviation |
| Measure 1 | | | | | | | | |
| Measure 2 | | | | | | | | |
| Measure 3 | | | | | | | | |

Table 2 contains information on **sample sizes** and **pre-intervention characteristics** for the **analytic sample**, for both the intervention and comparison groups. This information is useful for determining **baseline equivalence of the intervention and comparison groups**; it is also used in conjunction with information in Table 1 to determine sample attrition for randomized controlled trials.

Table 3. Post-Intervention Outcomes for the Analytic Sample and Estimated Effects (see III.C.)

| Outcome Measures | Intervention Group | | Comparison Group | | Estimated Effects | | |
|------------------|--------------------|--------------------|------------------|--------------------|-------------------|------------------|-------------|
| | Mean | Standard Deviation | Mean | Standard Deviation | Mean Difference | p-value (0.XXXX) | Effect Size |
| Measure 1 | | | | | | | |
| Measure 2 | | | | | | | |
| Measure 3 | | | | | | | |

Table 3 contains information on **post-intervention** outcomes for the **analytic sample**, for both the intervention and comparison groups, along with information useful for determining **the magnitude and significance of mean differences in outcomes between the intervention and comparison groups**. Reporting of the effect size as well as statistical significance is preferred, but not required.
